

Element Parameterizer Error

Posted by Reneej - 2009/07/31 18:14

A large portion of our watershed was successfully delineated and discretized. However, when we move on to the Element Parameterizer stage, we can not get past the first step. We choose the discretized watershed and click the default hydraulic geometry to default. When we hit process, it quickly comes up with the error message that reads:

```
FormParameterizerElements.btnProcess_Click()  
Object reference not set to an instance of an object.
```

We went back to our first step and realized that a hole bunch of no data existed outside of our watershed. Sort of like a frame, would this have any effect on the Element Paraeterizer stage?

Thank you!

Renee

Check your AGWA Home directory. The location you've set it to doesn't have all the required datafiles in it, so either you haven't downloaded them or you're inadvertently pointing it to the wrong place.
